

Document Archiving System in Document Control

1. Introduction

An archiving system is used to organize, store, and retrieve project documents efficiently. It ensures that all project records are controlled, traceable, and compliant with standards in construction and engineering projects.

2. Types of Archiving Systems

Digital Archiving

Storage of documents in electronic systems such as:

- Aconex
- SharePoint
- EDMS (Electronic Document Management System)

Physical Archiving

Hard copy filing systems stored in:

- Archive rooms
- Filing cabinets
- Project document centers

3. Document Classification

Documents are typically classified into:

- Technical Documents (Drawings, Specifications)
- Correspondence (Letters, Emails)
- Reports (Daily, Weekly, Monthly)
- Approvals & Submittals
- Contracts & Legal Documents

4. Coding System

Each document must have a unique code for easy tracking and retrieval:

Example:

PRJ-DC-001-REV0

- PRJ = Project Code
 - DC = Document Control
 - 001 = Sequence Number
 - REV0 = Revision Number
-

5. Workflow Process

1. Document Creation
 2. Review & Approval
 3. Registration in System
 4. Distribution
 5. Archiving (Digital & Physical)
 6. Retrieval when needed
-

6. Benefits

- Improved document tracking
 - Faster retrieval of information
 - Reduced risk of data loss
 - Better compliance and audit readiness
 - Organized project communication
-

7. Conclusion

A well-structured archiving system is essential for efficient document control management and successful project delivery.
